General Description

The GT-2217F5RK-BKGB is a receiving module that supports Dual-Band&Multi-Mode. It has built-in highly integrated GNSS receiver chip, supports multi band and multi system cm4f (main frequency 350mhz, 22nm Technology) chip of Third-generation BeiDou Navigation Satellite System (BDS-3). Besides,it is capable of tracking all global civil navigation systems (BDS,GPS,GLONASS,Galileo,QZSS,IRNSS and SBAS) in all bands.

GT-2217F5RK-BKGB module is based on the state of art BDS-3 architecture, integrating multi-band and multi-system GNSS RF and base band. This newly designed architecture makes this single chip achieve sub-meter level position accuracy without correction data from ground-based augmentation station and higher sensitivity, greater for improved jam resistance and multipath, provide a highly robust service in complicated environment.

GT-2217F5RK-BKGB module contains BK1662 positioning engine inside, featuring high sensitivity, low power consumption, and fast TTFF. The superior cold start sensitivity allows it to acquire, track, and get position fix autonomously in difficult weak signal environment. The receiver's superior tracking sensitivity allows continuous position coverage in nearly all outdoor application environments. The high performance signal parameter search engine is capable of testing 16 million time-frequency hypotheses per second, offering superior signal acquisition and TTFF speed.

Applications

- LBS (Location Based Service)
- PND (Portable Navigation Device)
- Vehicle navigation system
- Mobile phone

Features

- Build on high performance, low-power BK1662 chip set
- Ultra high Track sensitivity: -163dBm
- Concurrent reception of dual-band and multi-system satellite signals
- Supports all civil GNSS signals
- Supports BDS-3 signal
- Supports RTK;Protocol:RTCM3.3
- Extremely fast TTFF at low signal level
- Multipath detection and suppression
- Works with passive and active antenna
- Low power consumption: Max 25mA@3.3V
- NMEA-0183 compliant protocol or custom protocol
- Operating voltage:2.8V~4.2V
- SMD type with stamp holes
- Small form factor: 22±0.5x17±0.5x2.6±0.5mm
- Operating temperature -40 ~ +85ºC
- RoHS compliant (Lead-free)

1.2. Block Diagram

The GT-2217F5RK-BKGB is a high performance (BDS, GPS, GLONASS, Galileo, QZSS,IRNSS and SBAS) in all bands (L1,L5). satellite navigation receiver in a compact surface mount package. It is based on the BK1662 positioning technology, providing high performance signal acquisition and tracking. The simple UART serial interface and the standard NMEA-0183 protocol make usage of GT-2217F5RK-BKGB very easy and straightforward.

The GT-2217F5RK-BKGB module performs all the necessary system initialization, signal acquisition, signal tracking, data demodulation, and calculation of navigation solution autonomously.

2.3. UART Interface

The module provides one universal asynchronous receiver& transmitter serial port. The module is designed as DCE (Data Communication Equipment), following the traditional DCE-DTE (Data Terminal Equipment) connection. The module and the client (DTE) are connected through the signals shown in the following figure. It supports data baud-rate from 9600bps to 961200bps.

UART port:

TXD: Send data to the RXD1 signal line of DTE.
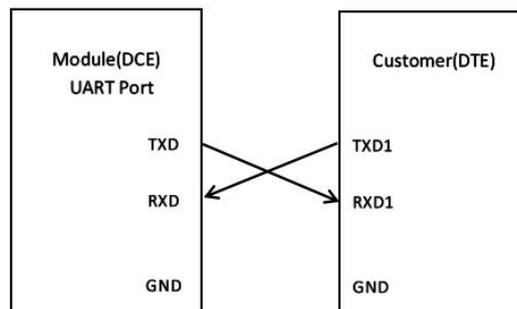

RXD: Receive data from the TXD1 signal line of DTE.

Figure 4:Serial Port Connection

This UART port has the following features:

● UART port can be used for NMEA Protocol output and proprietary commands input.

● The default output NMEA type setting is RMC, GGA, GSV ,GSA

● UART port supports the following data rates:

9600, 14400, 19200, 38400, 57600, 115200, 961200bps.

115200bps by default, 8 bits, no parity bit, 1 stop bit.

● Hardware flow control and synchronous operation are not supported.

The UART port does not support the RS-232 level but only CMOS level. If the module's UART port is connected to the UART port of a computer, it is necessary to add a level shift circuit between the module and the computer. Please refer to the following figure.

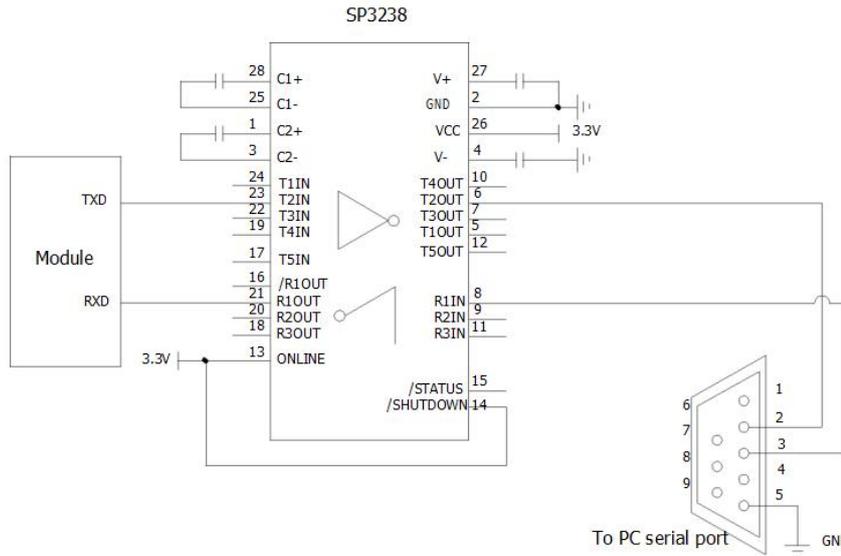

Figure 5: RS-232 Level Shift Circuit

3. Antenna Consideration

The GT-2217F5RK-BKGB is designed to use with active antenna, and passive antenna with higher antenna gain.

Passive ceramic patch antenna is low-cost and provides good sensitivity. 50-ohm output larger size ceramic patch antenna with higher antenna gain can be connected directly to RF input of the module. Usually the ceramic patch antenna and GT-2217F5RK-BKGB are mounted on opposite side of the PCB to reduce possibility of picking up digital noise. To improve signal reception performance, use larger ground plane under the patch antenna if possible; larger the ground plane, larger the overall antenna gain. The center frequency of the ceramic patch antenna changes with ground plane size. For optimal L1+L5 peration, frequency bandwidth of the antenna needs to cover 1174MHz ~ 1179MHz and 1573MHz ~ 1606MHz respectively when mounted on the PCB. It is usual to ask the ceramic patch antenna vendor to select or tune a patch antenna that best matches the customer PCB.

Active antenna is essentially a passive antenna with built-in LNA and a coaxial cable to connect the antenna to the module. It has the flexibility of being located remotely from the module, but requires antenna power. Active antenna usually costs more than passive patch antenna, but the performance in low signal environments is usually better. Active antenna with gain of 10 ~ 20dB and noise figure less than 1.5dB can be used with GT-2217F5RK-BKGB.

4. Power Supply Requirement

GT-2217F5RK-BKGB requires a stable power supply, avoid ripple on VCC pin (<50mVpp). Power supply noise can affect the receiver's sensitivity. Bypass capacitors of 10uF and 0.1uF is recommended to be placed close to the module VCC pin; the values could be adjusted according to the amount and type of noise present on the supply line.

5. Backup Supply

The purpose of backup supply voltage pin (VBAT) is to keep the SRAM memory and the RTC powered when the module is powered down. This enables the module to have a faster time-to-first-fix when the module is powered on again. The backup current drain is less than 12μA. In normal powered on state, the internal processor access the SRAM and current drain is higher in active mode.

6. 1PPS Output

When using four or more satellites for 3D positioning，the rising edge of the pulse generating 1 pulse per second (Duration: 800 seconds) on 1PPS pins is aligned with the UTC seconds，and the accuracy is about 20nS. When it is not positioned, it outputs a constant low pulse.

7. Layout Guidelines

Separate RF and digital circuits into different PCB regions.

It is necessary to maintain 50-ohm impedance throughout the entire RF signal path. Try keeping the RF signal path as short as possible.

Do not route the RF signal line near noisy sources such as digital signals, oscillators, switching power supplies, or other RF transmitting circuit. Do not route the RF signal under or over any other components (including GT-2217F5RK-BKGB), or other signal traces. Do not route the RF signal path on an inner layer of a multi-layer PCB to minimize signal loss.Avoid sharp bends for RF signal path. Make two 45-deg bends or a circular bend instead of a single 90-degree bend if needed.

Avoid vias with RF signal path whenever possible. Every via adds inductive impedance. Vias are acceptable for connecting the RF grounds between different layers. Each of the module's ground pins should have short trace tying immediately to the ground plane below through a via.

The bypass capacitors should be low ESR ceramic types and located directly adjacent to the pin they are for.

8. ESD handling precautions

GT-2217F5RK-BKGB series modules are Electrostatic Sensitive Devices (ESD). Observe precautions for handling! Failure to observe these precautions can result in severe damage to the GPS receiver!

GPS receivers are Electrostatic Sensitive Devices (ESD) and require special precautions when handling. Particular care must be exercised when handling patch antennas, due to the risk of electrostatic charges. In addition to standard ESD safety practices, the following measures should be taken into account whenever handling the receiver:

✧ Unless there is a galvanic coupling between the local GND(i.e. the work
    table) and the PCB GND, then the first point of cont act when handling
    the PCB must always be between the local GND and PCB GND.

✧ Before mounting antenna patch,connect ground of the device When

handling the RF pin, do not come into contact with any charged capacitors and be careful when contacting materials that can develop charges (e.g. patch antenna ~10pF, coax cable ~50-80pF/m, soldering iron..…)

✧ To prevent electrostatic discharge through the RF input, do not touch any exposed antenna area. If there is any risk that such exposed antenna area is touched in non ESD protected work a rea, implement proper ESD protection measures in the design.

✧ When soldering RF connectors and patch antennas to the receiver's RF pin, make sure to use an ESD safe soldering iron (tip).

10. Manufacturing, Packaging Information

10.1. Assembly and Soldering

GT-2217F5RK-BKGB module is intended for SMT assembly and soldering in a Pb-free reflow process on the top side of the PCB. It is suggested that the minimum height of solder paste stencil is 100um to ensure sufficient solder volume. Pad openings of paste mask can be increased to ensure proper soldering and solder wetting over pads. It is suggested that the peak reflow temperature is 220~240℃ (for SnAg3.0Cu0.5 alloy). The absolute maximum reflow temperature is 260℃. To avoid damage to the module when it is repeatedly heated, it is suggested that the module should be mounted after reflow soldering for the other side of PCB has been completed. Recommended reflow soldering thermal profile is shown below:

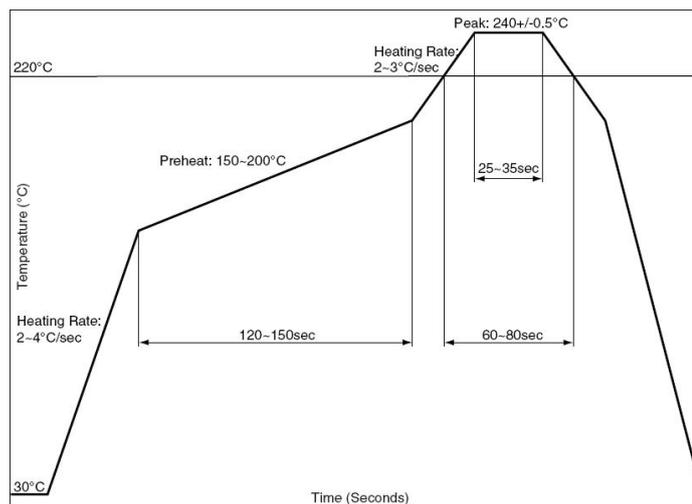

Figure 9: Recommended Reflow Soldering Thermal Profile

10.2. Moisture Sensitivity

GT-2217F5RK-BKGB module is sensitive to moisture. To prevent GT-2217F5RK-BKGB from permanent damage

during reflow soldering, baking before reflow soldering is required in following cases:

✧ Humidity indicator card: One or more indicating spots are no longer blue.

✧ The seal is opened and the module is exposed to excessive humidity.

GT-2217F5RK-BKGB shall be baked for 192 hours in a cryogenic environment at 40°C+5°C/-0°C and <5%RH, or for 24 hours in a high-temperature environment at 125°C±5°C.As the plastic packaging tape is not heat-resistant, the module should be removed from the tape before baking, otherwise, the tape will be damaged due to high temperature heating, you can also refer to the actual production technology of the SMT factory.

10.3. Tape and Reel Packaging

✧ The packing picture is for reference only, and the actual shipment shall prevail.

11. Supported GNSS augmentation systems

11.1 DGNSS – Differential GNSS

The RTK navigation mode needs to work in the data mode provided by RTCM version 3.3. The GT-2217F5RK-BKGB supports DGNSS function according to RTCM 10403.3 protocol. The decoded RTCM3.3 message is shown in the following table:

Table 7

No.	Data type	Message type	Description
1	RTCM 1074	MSM4	GPS pseudo-distance,Carrier phase,Carrier-noise ratio
2	RTCM 1077	MSM7	High precision GPS pseudo-distance,Carrier phase,Doppler,Carrier-noise ratio
3	RTCM 1084	MSM4	GLONASS pseudo-distance,carrier phase,carrier-noise ratio

12. NMEA 0183 Protocol

The output protocol supports NMEA-0183 standard. The implemented messages include RMC, GGA, GSV ,GSA messages. The NMEA message output has the following sentence structure: $AACCC，c-c*hh.

Table 8: The NMEA sentence structure

Character	HEX	Description
"$"	24	Start of sentence.
Aaccc		Address field. "aa" is the talker identifier. "ccc" identifies the sentence type.
","	2C	Field delimiter.
C–c		Data sentence block.
"*"	2A	Checksum delimiter.
Hh		Checksum field.
<CR><LF>	0D0A	Ending of sentence. (carriage return, line feed)

The formats of the supported NMEA messages are described as follows:
$GNGGA,$GNGSA,$GPGSV,$BDGSV,$GLGSV,$GAGSV,$IRGSV,$GNVTG,$GNRMC.

Table 9: Overview of NMEA messages

$GNGGA	Time, position, and fix related data of the receiver.
$GNGSA	Used to represent the ID of satellites which are used for position fix. When GPS&GLONASS&Galileo & BDS satellites are used for positioning solutions, the ID of available positioning satellites is counted and output with multiple statements.
$GPGSV $GLGSV $GAGSV $BDGSV $IRGSV	Satellite information about elevation, azimuth and CNR, satellites are used in position solution, a $GPGSV sentence is used for GPS satellites, a $GLGSV sentence is used for GLONASS satellites, a $GAGSV sentence is used for GALILEO satellites. $BDGSV sentence is used for BDS satellites. And $IRGSV sentence is used for IRNSS satellites.
$GNVTG	Course and speed relative to the ground
$GNRMC	Time, date, position, course and speed data.
